

Case reports: Recurrent Fracture after Operative Treatment for a Tibial Stress Fracture

Last Updated Wednesday, 28 March 2007

Clinical Orthopedics and Related Research

Pandya, Nirav K MD, et al. - We report a patient with a recurrent stress fracture and subsequent nonunion around an intramedullary nail placed for treatment of a more proximal, chronic tibial stress fracture. After 9 months of failed nonoperative treatment, we performed an exchange intramedullary nailing with open bone graft. At 8 months postoperatively, the patient showed clinical and radiographic signs of healing
