

Anterior Knee Pain and Thigh Muscle Strength After Intramedullary Nailing of a Tibial Shaft...

Last Updated Wednesday, 28 March 2007

Journal of Orthopaedic Trauma

Vaisto, Olli MD, et al. - Conclusion: Based on this prospective long-term follow-up study, it appears that the anterior knee pain symptoms that are present after intramedullary nailing of a tibial shaft fracture disappear in a number of patients 3 to 8 years after surgery. Quadriceps, but not hamstring weakness, and lower functional knee scores are associated with anterior knee pain at 8 years
