

Stable occurrence of knee and hip total joint replacement in Central Finland between 1986 and 2003:

Last Updated Wednesday, 28 March 2007

Annals of Rheumatic Diseases

Tuulikki Sokka, et al. - Conclusion: The prevalence of TJR surgery has increased 2 10-fold in patients without rheumatoid arthritis patients, associated with an ageing population, but has not increased in patients with rheumatoid arthritis between 1986 and 2003. These data are consistent with emerging evidence that long-term outcomes of rheumatoid arthritis have improved substantially, even before the availability of biological agents
